

Beneficial Microorganisms can be negatively effected by chlorinated water. We recommend the GARD'N GRO DECHLORINATOR for the water used to make Compost Tea and for the water used to dilute the Compost Tea solution for tank mixing.

Because Compost Tea consists of solid particles, injectors are not recommended. To reduce damage to microorganisms we suggest Pumping Systems and Application Nozzles that reduce the impact and handle the Compost Tea solution as gently as possible.

For Residential use we suggest the Rittenhouse Horticultural Sprayer

For Commercial use - 200gal Centrifugal Skid Sprayer or Low Pressure Spray Kit (both of these use Centrifugal Pumps). Suction Filters should be removed for Compost Tea applications.

For Turf application / Soil drenching we recommend the Comjet Spray Gun , specially designed to handle the particulates without clogging.

For Foliar / Tree Shrub with maximum height of 15' application the MeterJet Spray Gun works well and for a maximum of 25' - 30' use the Heavy Duty Hose Nozzle
