

Weed Spray Gun

This top quality gun assembly is used for spraying herbicides around fence lines, trees, sidewalks, and areas that where a 30", or less, pattern width is required. More than 30", the gun tends to spray on your feet.

The XR8004 nozzle features a very good droplet size for Roundup, and maintains good drift control. The XR nozzles have a wide pressure range, lowering the psi gives you a larger droplet size, thereby, lower drift.

Other nozzle sizes are 8005-8006, are commonly used, however, more runoff will occur.

The trigger assembly is 'rebuildable', and replacement triggers are available separately.

Different wand sizes can also be ordered separately. Wands such as 48" models, can be used to spray while sitting on a tractor seat. The spray gun assembly comes with a no-drip check valve screen to protect the nozzle from plugging and keeps the wand from draining each time the trigger is shutoff.

The windcone is the best accessory for reducing drift. However, your pattern is reduced to 18" wide. When using the windcone for continuous spray, two hands are necessary, one on the trigger, one hand part way down on the wand, due to the additional weight of the windcone.
