

Long Range Tree Gun

If the bulk of your spraying is 30' and below, the JD9-C gun is probably your best bet, because of the 1 handed operation and light weight.

When doing high tree spraying the Long Range Tree Gun is the best. The gun requires both hands to operate, one hand on the rear on/off trigger, the other hand for the centre mounted pattern controller.

The gun is repairable, and repair kits and replacement nozzles are readily available.

Years ago, we tested this gun against the FMC Tree Gun, at the time, it was the industry standard, and it 'out-performed' it. This gun is now the industry standard, and has proved to be a real workhorse for reliability.

A little hint for max. height, adding insecticidal soap, such as safer's, to your tank, you can increase your distance by reducing friction and acting as a sticker, holding the spray pattern together, not letting the droplets to separate.

Choosing nozzles should be based on the pump you have. A good rule of thumb for tree spraying is to hold back 1/3 of the pump's volume to create pressure. Ex. 20 GPM nozzle output would require a 30 GPM pump. This gun is also used aircraft deicing.
