

WICK WEEDER

OPERATING INSTRUCTIONS

To fill, place filler plug end in upright position, remove end plug and fill the handle only. Filling the remaining portion (elbow to filler plug) can result in some initial dripping. Tighten plug securely. When starting with dry wicking material allow time for the wick to saturate. Shake to speed up saturation. Excessive shaking can cause dripping. In normal operation the weeder will feed rapidly without dripping. If you momentarily need faster herbicide delivery, shake as needed. If the unit drips while upright and stationary check the filler plug for a proper seal. Do not raise the head of the weeder above the handle while in use. Doing so will result in air entering and dripping will result.

IMPORTANT: When using a nonselective herbicide such as Roundup in the weeder any plant the applicator contacts may be killed! When the wiper is being used to selectively control weeds from around desirable plants such as lawn, shrubs, trees, berries, etc. care must be taken not to allow contact of the herbicide saturated wiper head to touch the vegetation of the desirable plants.

STORAGE & CLEANUP: Remove the unused herbicide, and do not allow to freeze. Triple rinsing the weeder and applicator sleeve with ample water is recommended procedure for most chemicals.
